

Sing und Tanz

Sing und Tanz is an Interactive Multimedia Installation aimed at young audiences in which a world of colorful real-time visuals is displayed accordingly to the movements and voices of our visitors. The more singing and dancing, the better!

Participants are encouraged to use their voice in order to display the visuals in the screen. A hidden microphone is constantly monitoring the audio conditions and reproducing previously recorded videos (specifically created for the installation) correspondingly with the amplitude of the participant's voice. Real-time video processes are also reacting to these differences in amplitude, adding an additional spark to the experience. Furthermore, a motion sensing input device is tracking the space in search for bodies, and cropping the resulting visuals to the figure of the participant. In this way, the self-recognition aspect is enhanced not only by the use of the voice, but by the experience of the body itself.
